Initiative Description	Adding a Custom Domain setting feature to the Tracker menu for Checkout Forms to prevent domain synchronization issues with Landing Pages.
Team Name	Everpro - GSC
Stakeholder	
UT Required	No
Why there is no UT	
Tracker	No
New Feature	No

What is the Problem Statement?*

What are the pain points we are trying to solve?

Users (advertisers) are facing issues when running ads on platforms like Google Ads. Their ads are frequently rejected or flagged as "Invalid," "Compromised site," or "Malicious software".

The main issue is the mismatch (lack of synchronization) between the domain used on the **Landing Page** and the domain on the **Checkout Form**. Because the domains are different or unsynchronized, ad systems detect this as suspicious activity.

Where is the user when they're using the product?

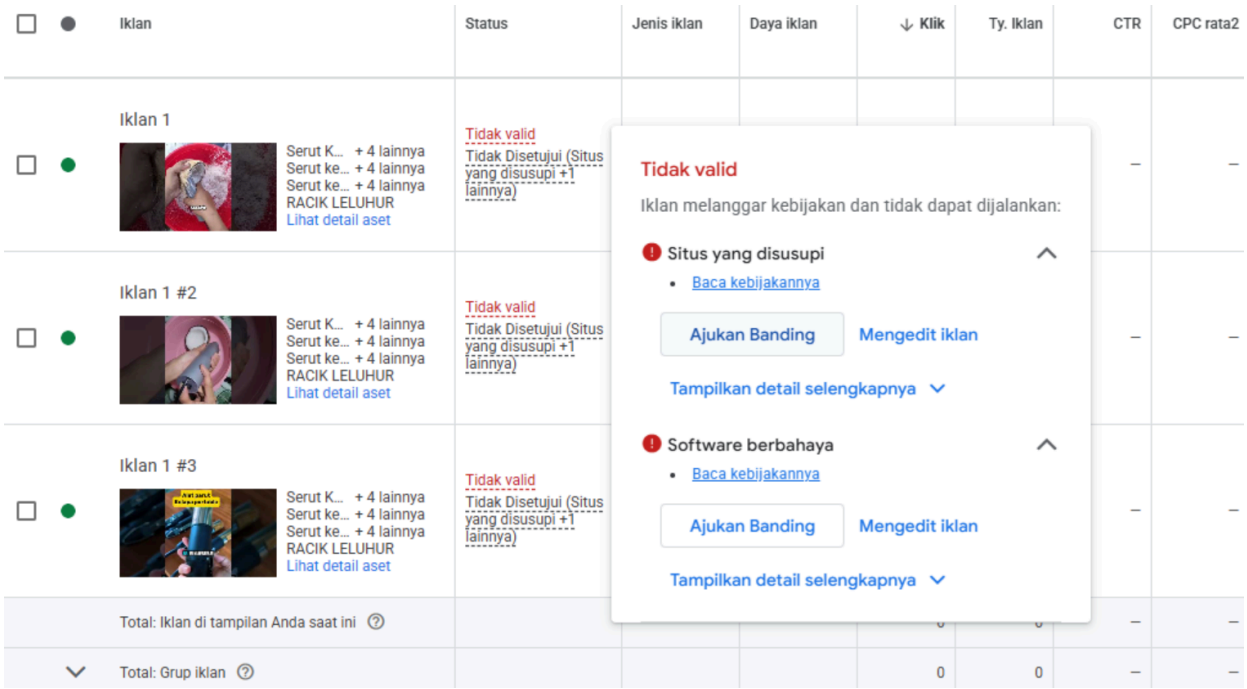
Users are on the Everpro dashboard, specifically when setting up sales funnels in the Product and Tracker menus

Who are the Users?

Everpro users who utilize the Checkout Form feature and run paid ads for their products especially on GTM.

When does the problem occur?

The problem occurs when users run ads, and Google/ad platforms crawl the destination link. The domain mismatch causes the ad to be rejected.



Why is the problem important?

If ads are rejected, users cannot sell or generate traffic. Statuses like "Compromised site" or "Malicious software" also severely damage the user's ad account reputation. This solution is crucial to ensure smooth ad operations for users.

How are users reaching their goals by using the product?

Currently, users might have to use manual methods or stick with the system-provided default domain, which unfortunately triggers these synchronization issues.

What is the current statement? (*if improvement*)

Currently, the **Product > Tracker** menu allows users to configure "Tracker" (Manual/Automatic) and "Meta Pixel" settings.

However, **there is no option to set a Custom Domain for the Checkout Form** in this menu.

- Users cannot synchronize the Checkout Form domain with their Web Builder Landing Page domain.
- The system currently lacks validation to prevent domain conflicts, meaning a domain used in the Web Builder could potentially "clash" if manually forced elsewhere, or simply cannot be reused properly for the checkout form

Scope*

In Scope:

- **Menu Renaming:** Rename menu sidebar "Tracker" to "Domain & Tracker" to represent the function includes Pixel and Custom Domain settings.
- **Add Domain Menu in Tracker:** Add a new domain settings section within the Domain & Tracker menu
- **UI/UX Custom Domain:** The settings interface will adopt the existing design from the "Web Builder Landing Page" (referencing Image 2 in the appendix), allowing users to select or set a custom domain.
- **Domain Validation (Conflict Check):** The system must ensure the domain input for the Checkout Form **does not conflict** with the domain already used in the Web Builder.

Out of Scope:

- Domain settings for features outside of Checkout Form/Tracker.

What is the Proposed Solution?*

build a **Custom Domain feature specifically for Checkout Forms**, accessible via the Tracker menu. This solution includes:

1. **Menu Access:** Users navigate to Product > Domain & Tracker. A specific tab or section for "Domain" settings will be added here.
2. **Configuration Mechanism:**
    - Users can select or connect their custom domain to match the Landing Page domain.

    - Visually and functionally, this feature will replicate the ease of domain setup already present in the **Web Builder** feature (as a visual benchmark).
3. **Error Prevention:**
    - Implement backend validation to prevent double usage or conflicts between Web Builder domains and Checkout Form domains.
    - The goal is to ensure domain synchronization happens smoothly without breaking other active domain functions.
4. **URL Structure Standardization:**

    Establish a standard URL structure to ensure the Checkout Form domain is recognized as a sub-path of the main Landing Page domain, rather than a separate entity.

    - **Landing Page URL:** `[custom-domain]` (e.g., *https://www.google.com/search?q=coolstore.com*)
    - **Checkout Form URL:** `[custom-domain]/checkout/[form-slug]` (e.g., *coolstore.com/checkout/promo-lebaran*)

    Note: Adding a specific path like "/checkout/" or a unique identifier is required to avoid routing conflicts with the main Landing Page.

The Success Metrics*

- **Primary Metric:** Reduction in support tickets/complaints regarding rejected ads (Google Ads Disapproved) due to "Destination Mismatch" or "Compromised Site."
- **Adoption Rate:** Percentage of active users setting up Custom Domains in the Tracker menu.

User Stories

No	*User Story*	*Acceptance Criteria*	*Design*	*Notes*

1	**Pembaruan Nama Menu & Akses Pengaturan** Sebagai user, saya ingin mengakses pengaturan domain langsung dari menu Tracker agar bisa mengatur custom domain untuk Checkout Form.	**AC 1.1 perubahan nama menu** **GIVEN** User berada di dashboard Everpro dan melihat sidebar menu **WHEN** User mencari pengaturan Produk > Tracker **THEN** Nama menu "Tracker" telah berubah menjadi "Domain & Tracker" **AC 1.2 tab domain** **GIVEN** User mengklik menu "Domain & Tracker" **WHEN** Halaman pengaturan terbuka **THEN** User dapat melihat tab atau bagian baru khusus untuk pengaturan "Domain"		
2	***Konfigurasi Custom Domain*** *Sebagai user, saya ingin menambahkan dan mengelola custom domain saya ke Checkout Form dengan langkah yang jelas dan terpandu di dalam sistem.*	**AC 2.1 daftar domain** **GIVEN** *User* berada di menu Domain & Tracker dan memilih tab "Domain custom". **WHEN** Halaman termuat. **THEN** Sistem menampilkan tabel daftar domain dengan kolom: Domain, Tipe (Landing Page/Checkout Form), Status, Default slug, dan Aksi . Terdapat juga tombol "Tambah domain" di kanan atas. **AC 2.2 Pop-up Tambah Domain Baru** **GIVEN** *User* mengklik tombol "Tambah domain". **WHEN** Sistem memunculkan *pop-up*. **THEN** *Pop-up* menampilkan instruksi pengaturan DNS (mencakup instruksi A Record dan pilihan IP: 54.255.72.88, 13.215.218.147, 13.228.134.104) . Terdapat *field* input URL, tombol "Cek domain", "Kembali", dan "Simpan" . **AC 2.3: Tooltip Informasi Struktur URL Checkout** - **GIVEN** *User* memiliki domain dengan tipe "Checkout Form" yang berstatus "Terhubung" . - **WHEN** *User* mengarahkan kursor (*hover*) ke *icon* "i" (Informasi) di dekat kolom Default slug . - **THEN** Muncul *tooltip* berisi teks: "Khusus untuk CO Form akan ada tambahan /checkout untuk pembeda dengan URL Landing page" .	 	

		[redacted]		
3	**Pengaturan Domain pada Level Form Produk** Sebagai *user*, saat mengatur Checkout Form untuk suatu produk, saya ingin bisa langsung memilih atau menambahkan *custom domain* dari halaman pengaturan tersebut tanpa harus berpindah menu.	**AC 3.1: Memilih Domain pada Dropdown** **GIVEN** *User* berada di Langkah 2 ("Pengaturan form") saat membuat atau mengedit form produk. **WHEN** *User* mengklik *field* "Pilih domain". **THEN** Sistem menampilkan *dropdown* berisi daftar *custom domain* yang tersedia. **AC 3.2: Shortcut Tambah Domain dari Dropdown** **GIVEN** *User* membuka *dropdown* "Pilih domain" . **WHEN** *User* mengklik opsi "Refresh + Tambah Domain". **THEN** Sistem memunculkan *pop-up* "Tambah domain" yang sama fungsinya dengan di menu Domain & Tracker .		

4	**Halaman Sukses Publikasi & Fitur Embed Form** Sebagai *user*, setelah form berhasil dipublikasi, saya ingin mendapatkan URL *checkout* yang sudah memakai *custom domain*, dan bisa dengan mudah mengambil kode *embed* melalui tombol yang tersedia di halaman tersebut.	**AC 4.1: URL Custom pada Halaman Sukses** **GIVEN** *User* telah selesai mengatur form dan produk berhasil dipublikasi. **WHEN** Sistem menampilkan halaman sukses publikasi. **THEN** Tautan yang tertera di dalam kotak *copy link* sudah menggunakan format *custom domain*, contoh: `https://[custom-domain]/checkout/[form-slug]`. **AC 4.2: Penambahan Tombol Akses Embed Form** **GIVEN** *User* berada di halaman sukses publikasi produk. **WHEN** *User* melihat pilihan aksi di bagian bawah halaman. **THEN** Sistem menampilkan tambahan tombol baru yaitu "< > Embed checkout form" di antara opsi "Kembali ke Daftar Produk" dan tombol utama "Lihat checkout form". **AC 4.3: Membuka Pop-up Embed Form** **GIVEN** *User* melihat tombol "Embed checkout form". **WHEN** *User* mengklik tombol tersebut. **THEN** Sistem memunculkan *pop-up* "Embed Form" yang berisi pengaturan *Embed Mode*, *Redirect*, dan *Embed Code*. **AC 4.4: Pilihan Domain pada Dropdown Redirect** **GIVEN** *User* berada di dalam *pop-up* "Embed Form". **WHEN** *User* mengklik *dropdown* di bawah label "Redirect". **THEN** Sistem menampilkan daftar domain yang sudah terhubung untuk dipilih (misalnya `gudangcoklat.id/checkout`). **AC 4.5: Perubahan Otomatis pada Embed Code** **GIVEN** *User* melihat daftar domain di *dropdown* "Redirect". **WHEN** *User* memilih salah satu *custom domain* dari daftar tersebut. **THEN** Teks URL di dalam kotak "Embed Code" secara otomatis berubah (*update*) menyesuaikan dengan domain yang baru saja dipilih *user*.	  	
5	**Validasi & Pencegahan Konflik Domain (Sistem**	**AC 5.1: Pengecekan Backend**		

	Tersembunyi) Sebagai sistem, saya harus memvalidasi domain yang dimasukkan agar tidak bentrok dengan domain Web Builder, sehingga operasional iklan *user* tidak terganggu.	**GIVEN** *User* memasukkan *custom domain* untuk Checkout Form dan mengklik simpan. **WHEN** Sistem memproses permintaan. **THEN** Sistem melakukan validasi *backend* untuk mengecek apakah domain tersebut sudah digunakan di Web Builder. **AC 5.2: Penggagalan Simpan Jika Konflik** **GIVEN** Sistem menemukan bahwa domain sudah dipakai di Web Builder. **WHEN** *User* mencoba menyimpan pengaturan. **THEN** Proses simpan digagalkan untuk mencegah konflik dan memastikan fungsi domain yang aktif tidak rusak.		
6	**Standarisasi Struktur URL Checkout (Sistem)** Sebagai sistem, saya harus membedakan URL Checkout Form dari URL Landing Page utama dengan menambahkan *path* khusus, agar tidak terjadi konflik *routing* saat *user* menggunakan domain yang sama.	**AC 6.1: Pembentukan URL Standar** **GIVEN** *User* telah berhasil menyambungkan *custom domain*. **WHEN** Domain tersebut aktif dan diterapkan pada suatu Checkout Form. **THEN** Sistem secara otomatis membentuk URL akhir form dengan mengikuti struktur standar: `[custom-domain]/checkout/[form-slug]`.
